

Application No. 10/085,836

Amendment to the Claims

1. (previously presented) A computer implemented method for detecting whether a
5 received information content is identical to a plurality of stored information contents,
comprising the steps of:
- calculating a plurality of parameter values by applying an algorithm that
calculates each of a plurality of stored information contents to a predetermined
precision, each parametric value representing one of the plurality of stored
10 information contents;
 - storing the plurality of parameter values;
 - responsive to receiving a new information content, calculating a parametric
value representing the received information content;
 - comparing the parameter value representing the received information content
15 with the plurality of stored parameter values; and
 - indicating that the received information content is identical to a stored
information content if the corresponding parameters values are equal.
2. (original) The method of Claim 1, wherein the plurality of information contents
20 include electronic mails.
3. (original) The method of Claim 1, wherein the information content is received
through a global communication network.
- 25 4. (original) The method of Claim 3, wherein the global communications network
includes the Internet.
5. (original) The method of claim 1, wherein each parameter is determined based
on an order and a value of each character in the corresponding information content.
30
6. (previously presented) A computer implemented method for comparing a
plurality of information contents, comprising the steps of:
- calculating a plurality of parameter values by applying an algorithm that
calculates each of a plurality of stored information contents to a predetermined

Application No. 10/085,836

precision, each parametric value representing one of the plurality of information contents;

5 comparing the plurality of parameter values, such that equality between a pair of the plurality of parameter values indicates that corresponding pair of the plurality of information contents is identical.

7. (original) The method of Claim 6, wherein the plurality of information contents include electronic mails.

10 8. (original) The method of claim 6, wherein each one of the plurality of parameters is determined based on an order of each character in the corresponding information content.

15 9. (original) The method of claim 8, wherein each one of the plurality of parameters is determined based on a value of each character in the corresponding information content.

10. (original) The method of Claim 9, wherein the value includes ASCII value.

20 11. (previously presented) A computer readable medium embodying a computer implemented method for comparing a plurality of information contents, the computer implemented method comprising the steps of:

calculating a plurality of parameter values by applying an algorithm that calculates each of a plurality of stored information contents to a predetermined
25 precision, each parametric value representing one of the plurality of information contents;

comparing the plurality of parameter values, such that equality between a pair of the plurality of parameter values indicates that corresponding pair of the plurality of information contents is identical.

30

12. (previously presented) A system for comparing a plurality of information contents, comprising:

at least one user terminal;

Application No. 10/085,836

means for calculating a plurality of parameter values by applying an algorithm that calculates each of a plurality of stored information contents to a predetermined precision, each parametric value representing one of the plurality of information contents;

5 means for comparing the plurality of parameter values, such that equality between a pair of the plurality of parameter values indicates that corresponding pair of the plurality of information contents is identical; and

at least one database containing the plurality of information contents and the plurality of parameters.

10

13.(original) The computer system of Claim 12, further implemented on a global telecommunications network.

14.(original) The computer system of Claim 13, wherein the global
15 telecommunications network includes the Internet.
